Call them lowest-CV representatives of the major ADMIXTURE modes.

Replicate solutions were grouped into modes after aligning ancestry components. For each K, we plotted the lowest-CV replicate from the most frequently recovered mode. When modes were tied in frequency, we selected the mode containing the lowest-CV solution.

Concise figure-caption wording:

Representative ADMIXTURE solutions for K = 16–22, showing the lowest-CV replicate from the major mode at each K.

Because K19 and K22 had tied modes, the fully accurate caption would be:

Representative ADMIXTURE solutions for K = 16–22. Each panel shows the lowest-CV replicate from the most frequently recovered mode; when modes were equally frequent, the mode with the lower CV error was selected.
